# Fair Division with Money 

by

## David Housman

Mathematics and Computer Science Goshen College

## Inheritance Problem

Bob, Carol, and Doug have inherited equal shares in their mother's estate consisting of an old cabin on an acre of land in the country, sterling silverware for twelve, and a two year old sports car. The siblings have different opinions about the worth of each item as given in the table below (numbers are in thousands of dollars) and they are willing to either give or receive cash to help obtain a fair allocation of the estate. Suggest a solution.

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

## Efficient Allocations

An allocation is efficient if there is no other allocation that is better for everyone.

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

If each sibling is given one-third of each item, then Bob values his bundle at $v_{B}=54 / 3=\$ 18$.
Carol values her bundle at $v_{C}=60 / 3=\$ 20$. Doug values his bundle at $v_{D}=21 / 3=\$ 7$.

If we give Bob the cabin, Carol the car, and Doug the silver, then the values are $\bar{v}_{B}=\$ 30, \bar{v}_{C}=\$ 25$, and $\bar{v}_{D}=\$ 8$.
So, the first allocation is not efficient.

Theorem. An allocation is efficient if and only if each item is given to the sibling who values it the most.

## First Price Auction

Sell each item to the highest bidder, who pays the amount bid, and the money collected is divided equally among the siblings.

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

Bob receives the cabin and pays $\$ 30$.
Carol receives the silver and car and pays $20+25=\$ 45$.
Doug receives and pays nothing.
The $30+45+0=\$ 75$ in the pot is divided evenly.
Bob receives the cabin and pays $30-25=\$ 5$. Bob values this at $30-5=\$ 25$.

Carol receives the silver and car and pays $45-25=\$ 20$.
Carol values this at $20+25-20=\$ 25$.
Doug receives $\$ 25$. Doug values this at $\$ 25$.

## Second Price Auction

Sell each item to the highest bidder, who pays the second highest amount bid, and the money collected is divided equally among the siblings.

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

Bob receives the cabin and pays $\$ 15$.
Carol receives the silver and car and pays $8+19=\$ 27$.
Doug receives and pays nothing.
The $15+27+0=\$ 42$ in the pot is divided evenly.
Bob receives the cabin and pays $15-14=\$ 1$. Bob values this at $30-1=\$ 29$.

Carol receives the silver and car and pays $27-14=\$ 13$.
Carol values this at $20+25-13=\$ 32$.
Doug receives \$14. Doug values this at \$14.

## Knaster's Method

Sell each item to the highest bidder and distribute money so that each sibling receives the same incremental value above their "fair share" of the estate ( $1 / 3$ of what they think the estate is worth).

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

The value obtained by each sibling should be
$v_{B}=\frac{54}{3}+\lambda=18+\lambda \quad v_{C}=\frac{60}{3}+\lambda=20+\lambda \quad v_{D}=\frac{21}{3}+\lambda=7+\lambda$
Adding these equalities, we obtain
$75=v_{B}+v_{C}+v_{D}=45+3 \lambda \Rightarrow \lambda=10$
Bob's bundle should be worth $18+10=\$ 28$ : receipt of the cabin and a payment of $\$ 2$.

Carol's bundle should be worth $20+10=\$ 30$ : receipt of the silver and car and a payment of $\$ 15$.

Doug's bundle should be worth $7+10=\$ 17$ : receipt of $\$ 17$.

## Equitable and Efficient Method

Sell each item to the highest bidder and distribute money so that each sibling receives the same fraction of the estate (from their own perspectives).

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

Each sibling should receive the same fraction of the estate:
$v_{B} / 54=v_{C} / 60=v_{D} / 21=\lambda$
Adding these equalities, we obtain
$75=v_{B}+v_{C}+v_{D}=54 \lambda+60 \lambda+21 \lambda=135 \lambda \Rightarrow \lambda=5 / 9$
Bob's bundle should be worth $(5 / 9) 54=\$ 30$ : receipt of the cabin.

Carol's bundle should be worth $(5 / 9) 60=\$ 33.33$ : receipt of the silver and car and a payment of $\$ 11.67$.

Doug's bundle should be worth $(5 / 9) 21=\$ 11.67$ : receipt of \$11.67.

## Moulin-Shapley Method

Sell each item to the highest bidder and distribute money so that each sibling receives his or her average, over sibling orders, marginal contribution to the group stand-alone values.

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

| Group | BCD | BC | BD | CD | B | C | D |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Stand-Alone Value | 75 | 75 | 57 | 60 | 54 | 60 | 21 |

| Order | Bob | Carol | Doug |
| :--- | ---: | ---: | ---: |
| BCD | 54 | 21 | 0 |
| BDC | 54 | 18 | 3 |
| CBD | 15 | 60 | 0 |
| CDB | 15 | 60 | 0 |
| DBC | 36 | 18 | 21 |
| DCB | 15 | 39 | 21 |
| Total | 189 | 216 | 45 |
| Average | 31.5 | 36 | 7.5 |

## Group Stand-Alone Allocations

No group of siblings receives more than its stand-alone value (maximum obtainable if the group owned the entire estate).

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

| Group | Stand-Alone <br> Value | Constraint |
| :--- | :---: | :--- |
| BCD | 75 | $v_{B}+v_{C}+v_{D}=75$ if efficient |
| BC | 75 | $v_{B}+v_{C} \leq 75 \quad \Leftrightarrow \quad v_{D} \geq 0$ |
| BD | 57 | $v_{B}+v_{D} \leq 57 \quad \Leftrightarrow \quad v_{C} \geq 18$ |
| CD | 60 | $v_{C}+v_{D} \leq 60 \quad \Leftrightarrow \quad v_{B} \geq 15$ |
| B | 54 | $v_{B} \leq 54$ |
| C | 60 | $v_{C} \leq 60$ |
| D | 21 | $v_{D} \leq 21$ |

The first-price action does not yield a group stand-alone allocation for our example because $v_{D}=25$.

## Group Rational Allocations

Each group of siblings receives at least its ownership value (maximum obtainable if the group owned a proportionate share of the estate).

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

| Group | Stand <br> Alone | Owner- <br> ship | Constraint |  |
| :--- | :---: | :---: | :--- | :--- |
| BCD | 75 | 75 | $v_{B}+v_{C}+v_{D}=75$ if efficient |  |
| BC | 75 | 50 | $v_{B}+v_{C} \geq 50 \quad \Leftrightarrow \quad v_{D} \leq 25$ |  |
| BD | 57 | 38 | $v_{B}+v_{D} \geq 38 \quad \Leftrightarrow \quad v_{C} \leq 37$ |  |
| CD | 60 | 40 | $v_{C}+v_{D} \geq 40 \quad \Leftrightarrow \quad v_{B} \leq 35$ |  |
| B | 54 | 18 | $v_{B} \geq 18$ |  |
| C | 60 | 20 | $v_{C} \geq 20$ | $l$ |
| D | 21 | 7 | $v_{D} \geq 7$ |  |

## Envy-Free Allocations

No sibling would prefer another's bundle to his or her own.

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Cabin | 30 | 15 | 5 |
| Silver | 5 | 20 | 8 |
| Car | 19 | 25 | 8 |
| Total | 54 | 60 | 21 |

Let $m_{i}$ be the money allocated to sibling $i$.

| Bob does not envy Carol. | $v_{B}=30+m_{B} \geq 24+m_{C}$ |
| :--- | :--- |
|  | $v_{B} \geq v_{C}-21$ |
| Carol does not envy Bob. | $v_{C}=45+m_{C} \geq 15+m_{B}$ |
|  | $v_{C} \geq v_{B}-15$ |
| Bob does not envy Doug. | $v_{B}=30+m_{B} \geq m_{D}$ |
|  | $v_{B} \geq v_{D}$ |
| Doug does not envy Bob. | $v_{D}=m_{D} \geq 5+m_{B}$ |
|  | $v_{D} \geq v_{B}-25$ |
| Carol does not envy Doug. | $v_{C}=45+m_{C} \geq m_{D}$ |
|  | $v_{C} \geq v_{D}$ |
| Doug does not envy Carol. | $v_{D}=m_{D} \geq 16+m_{C}$ |
|  | $v_{D} \geq v_{C}-29$ |

## Incompatibilities of the Properties

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Item | 30 | 27 | 3 |

Consider an efficient allocation.
If the allocation is group stand-alone, then $v_{D} \leq 3$.
If the allocation is envy-free, then $v_{B}=30+m_{B} \geq m_{C}, m_{D}$, $v_{C}=m_{C} \geq 27+m_{B}, m_{D}$, and $v_{D}=m_{D} \geq 3+m_{B}, m_{C}$. So, $m_{C}=m_{D}=m$. Since $m_{B}+m_{C}+m_{D}=0$, we have $30-2 m \geq m$ and $m \geq 27-2 m$. Since $m=v_{D}$, these imply $9 \leq v_{D} \leq 10$. Hence, the allocation cannot both be enny-free and group stand-alone.

If the allocation is group rational, then $v_{B}+v_{D} \geq 20$ and $v_{C}+v_{D} \geq 18$. Adding these inequalities together, we obtain $30+v_{D}=v_{B}+v_{C}+v_{D}+v_{D} \geq 38$, and so $v_{D} \geq 8$. Hence, the allocation cannot both be group rational and group standalone.

## Properties of Allocation Methods (Part 1)

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Item | 30 | 27 | 3 |

If the allocation is group stand-alone, then $v_{D} \leq 3$.
If the allocation is efficient and envy-free, then $9 \leq v_{D} \leq 10$. If the allocation is efficient and group rational, $v_{D} \geq 8$.

The first price auction obtains $v=(10,10,10)$, and so is not group stand-alone.

The second price auction obtains $v=(12,9,9)$, and so is not group stand-alone.

Knaster's obtains $v=(10+\lambda, 9+\lambda, 1+\lambda)=(13.3,12.3,4.3)$, and so is not group stand-alone, envy-free, or group rational.

Equitable obtains $v=(30 \lambda, 27 \lambda, 3 \lambda)=(15,13.5,1.5)$, and so is not envy-free or group rational.

Moulin-Shapley obtains $v=(16,13,1)$, and so is not envyfree or group rational.

## Properties of Allocation Methods (Part 2)

|  | Bob | Carol | Doug |
| :--- | :---: | :---: | :---: |
| Item | 30 | 10 | 10 |

Equitable obtains $v=(30 \lambda, 10 \lambda, 10 \lambda)=(18,6,6)$, and so $v_{B}+v_{C}=12$.

The stand-alone value for the group consisting of Carol and Doug is 10 , and so the equitable method is not group standalone.

## Summary

|  | Envy-Free | Group <br> Rational | Group <br> Stand-Alone |
| :--- | :---: | :---: | :---: |
| First Price <br> Auction | Yes | Yes | No |
| Second Price <br> Auction | Yes | Yes | No |
| Knaster's <br> Method | No | No | No |
| Equitable and <br> Efficient | No | No | No |
| Moulin- <br> Shapley | No | No | Yes |
